METOREX CARBON FOOTPRINT REPORT

Metorex commissioned a Corporate Carbon Footprint ("CCF") analysis to establish a baseline of energy usage and greenhouse gas emissions. The Group CCF, which was compiled according to greenhouse gas protocol guidance, showed total greenhouse gas ("GHG") emissions of 39 627 tons of CO₂-equivalent for 2010. The highest contributing site is Ruashi in the Democratic Republic of Congo ("DRC"), and the highest contributing energy source is that of the consumption of diesel fuel on mining sites. The use of hydro-power electricity from the DRC and Zambian power grids provides a relatively clean source of electricity. In line with global reporting standards, scope 1 emissions (direct on-site emissions) contribute 65 percent towards the total emissions, scope 2 emissions (indirect emissions from electricity consumption) contribute 3 percent, and scope 3 (other emissions from material transport and business travel) contribute 32 percent. The full report is now available on the Metorex website at www.metorexgroup.com.

Terence Goodlace, CEO, said: "The release of the Metorex Carbon Footprint Analysis Report provides the baseline from which the Group will monitor emissions and develop improvement plans with a firm basis for developing action plans to reduce carbon emissions."
